Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of NFLD. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage.⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. ¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), D. B. S.

¹Department store stocks at end of period at selling value. The sales and stocks data are revised series based on the results of the 1961 Census of Merchandise and Service Establishments. ²Due to changes in definition of department stores and the introduction of general merchandise stores, formerly included in all other stores, the 1968, 1969 and 1970 figures are not comparable with the data of previous years. Source: Department Store Sales and Stocks (63-002), D. B. S.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004). ²Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. ⁴Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁵Personal cash loans of over \$1,500, usually repaid in instalments. Amounts shown include interest and other unearned income finance charges. ⁶The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are repeated in the unadjusted form. ⁷Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. Sources: Credit Statistics (61-004), D. B. S.; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), D. B. S.

¹Column numbers refer to tables 3 and 4, section 11. ²Includes special transaction-trade, not shown separately. ³Includes scrap. ⁴The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁵Same series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), D. B. S.

¹Monthly averages for years 1967 and 1968 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. These groups covered all air carriers with gross annual flying revenues of over \$100,000 prior to January 1969 and over \$150,000 during 1969. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 95 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ³United States and other foreign carriers having scheduled services into and out of Canada. Excludes passengers in transit through Canada. ⁴Cargo includes air freight and express but excludes mail and excess baggage. Source: Civil Aviation (51-001), D.B.S.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments. ²Under the Technical and Vocational Training Assistance Act. ³Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁴Includes treatment and rehabilitation services. ⁵For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities - Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ⁶As of April 1, 1969 Industry and Trade and Commerce are combined.

Sources: Canada Gazette and Dept. of Finance.

residential construction was entirely due to increased price of the labour component; in non-residential construction both labour and materials contributed to the increase. The price for machinery and equipment rose at the same rate of 2.5 per cent as in 1969.

The Fourth Quarter 1970

Preliminary estimates of the National Income and Expenditure Accounts indicate an acceleration in the rate of economic activity in the closing quarter of 1970. The fact that a substantial gain was realized in spite of a major strike in the automobile industry suggests an improvement in the underlying trend of the economy. Gross National Expenditure at market prices, seasonally adjusted at annual rates, rose by 1.6 per cent to reach a level of \$86.4 billion. In each of the previous two quarters, the increases had been at a somewhat smaller rate of 1.4 per cent. As there was practically no change in the overall implicit price index in the quarter, the volume of physical production rose by 1.5 per cent. This was the largest gain in real terms since the third quarter of 1969.

The significant contributions to aggregate demand in the fourth quarter were found in personal expenditure on consumer goods and services, up 1.6 per cent; in government current expenditure on goods and services, up 3.4 per cent (half at the federal level); and in business gross fixed capital formation, up 2.9 per cent. Within consumer expenditure, semi-durable goods made the largest percentage gain, mostly on account of a sharp increase in spending on women's and children's clothing. Most durable goods also rose quite strongly, though a decline in spending on new cars, probably partly reflecting the automobile strike, dampened the rise in that category. The increase in business gross fixed capital formation was apparently due to an upsurge in residential construction, which rose by 12.7 per cent. Plant and equipment spending remained flat in the quarter, as an increase in non-residential construction was offset by a decline in machinery and equipment.

In contrast to the above mentioned categories of demand, investment in non-farm business inventories declined sharply, from an accumulation of \$760 million in the third quarter to a decumulation of \$652 million in the fourth quarter. The most notable depletion occurred in the stocks of motor vehicle dealers. However, inventory investment other than motor vehicles also fell quite sharply at all major industry levels.

The final quarter of the year saw the balance on current transactions in goods and services with non-residents rise spectacularly from a surplus of \$580 million to one of \$2,196 million, as a marginal increase in exports was dwarfed by a 7.6 per cent fall in imports. Most of the sharp drop in merchandise imports was in goods from the United States, particularly automotive products. (Exports of automotive products also fell in the quarter.) Lower

deficits in the travel and income accounts also contributed to the unprecedentedly large overall surplus.

The most notable development on the income side was a severe drop of 11.7 per cent in corporation profits. The drop was substantial even after allowing for the influence of the industrial dispute in the automobile industry. The declining trend in corporation profits which started in the first half of 1969 was sharply accentuated by this further setback which brought profits down to their 1967 level. Most other major income components rose in the quarter. The gain in labour income of 2.4 per cent represented an acceleration over the gains of 1.7 per cent in the third quarter and of 0.6 per cent in the second quarter. Both personal income and personal disposable income also showed appreciably larger gains than in previous recent quarters.

Price Movements

A feature of the year was the pronounced easing in the quarterly rates of increase of the implicit deflator for gross national expenditure. This was most evident in the final quarter, when it rose by a negligible 0.1 per cent. However, this easing was partly due to a substantial weight shift between the value of physical change in inventories, which declined steeply in the quarter, and the other components of gross national expenditure. Excluding inventories, the rise in the overall deflator was 0.4 per cent, compared with 0.8 per cent in the previous two quarters. The slowdown in these overall implicit price indexes reflected a slight decline in the implicit price index for personal expenditure, a deceleration in that for government current expenditure, and a stable implicit price index for exports. With the continuing appreciation of the Canadian dollar, import prices¹ fell for a second consecutive quarter. The decline in the deflator for merchandise imports of 1.5 per cent was especially notable. The price index for business gross fixed capital formation was the only major component to show an accelerated rise.

The decline in the price for personal expenditure on consumer goods and services—the first since the fourth quarter of 1963—was entirely due to a fall of 1.0 per cent in the non-durable goods component. A second consecutive sharp decline in food prices was responsible for the fall in non-durable prices. (Falling food prices in the quarter were due both to lower prices of imported food items, and to competitive price cutting by large retail chain stores.) The implicit price indexes for durable and semi-durable goods showed little change, while that for services, where increases were widespread, continued to rise at the same rate of 1.0 per cent as in the previous quarter.

¹ It may be noted that since imports are a negative entry in gross national expenditure a price decline in this component appears to raise the implicit price index. However, import prices will already have been reflected in the various other categories of gross national expenditure. The implicit price index is accordingly a price measure for domestically-produced goods and services.

The upsurge of 1.4 per cent in the implicit price index for business gross fixed capital formation contrasted sharply with the relatively small increases of less than half a per cent in the previous two quarters. The acceleration was mostly due to higher prices for construction. Increases in the prices for

residential and non-residential building resulted from a higher price for labour input, as material prices remained unchanged. In engineering construction, both labour and materials components showed increases.

ERRATA

Section 3, Tables 4.1 and 4.3 - Balance of International Payments

The present issue of the Canadian Statistical Review contains erroneous data in the above mentioned tables. The following series of Table 4.1 should read:

| Year or quarters | Non-merchandise transactions | | | Other current transactions |
|-----------------------------------|------------------------------|----------|---------|----------------------------|
| | Receipts | Payments | Balance | Balance |
| 1969 | 4,221 | 5,832 | -1,611 | |
| 1970 | 4,739 | 6,444 | -1,705 | |
| Unadjusted for seasonal variation | | | | |
| 1969 1 | 783 | 1,284 | -501 | |
| 2 | 1,061 | 1,477 | -416 | |
| 3 | 1,368 | 1,591 | -223 | |
| 4 | 1,009 | 1,480 | -471 | |
| 1970 1 | 911 | 1,487 | -576 | |
| 2 | 1,183 | 1,581 | -398 | |
| 3 | 1,559 | 1,812 | -253 | |
| 4 | 1,086 | 1,564 | -478 | |
| Adjusted for seasonal variation | | | | |
| 1969 1 | 1,005 | 1,389 | -384 | -166 |
| 2 | 1,057 | 1,453 | -396 | -170 |
| 3 | 1,039 | 1,477 | -438 | -178 |
| 4 | 1,120 | 1,513 | -393 | -170 |
| 1970 1 | 1,166 | 1,592 | -426 | -178 |
| 2 | 1,173 | 1,563 | -390 | -171 |
| 3 | 1,196 | 1,665 | -469 | -199 |
| 4 | 1,204 | 1,624 | -420 | -219 |

Data for the 3rd and 4th quarters 1970 of the column "Foreign Securities, new issues", Table 4.3 should read: 1970 3 -10
4 - 5

Section 10 Table 1 - Retail Trade

Errors have been identified in the following unadjusted data on Retail Trade, Section 10, Table 1.

(a) Total all trades - 1968, 69, 70

(d) Furniture, T.V., radio and appliances - 1970

(b) General merchandise - 1968, 69, 70

(e) All other trades - 1970

(c) General stores - 1970

and the following provincial data:

Newfoundland 1968, 69, 70
Prince Edward Island 1970
Nova Scotia 1968, 69, 70
New Brunswick 1970
Quebec 1968, 69, 70

Ontario 1968, 69, 70
Manitoba 1968, 69, 70
Saskatchewan 1968, 69, 70
Alberta 1970
British Columbia 1970

In addition the seasonally adjusted data for the above trade groups (items a to e) as well as all seasonally adjusted data on retail sales by provinces are incorrect due to inconsistencies in the base year data (1966). Table 5, (Selected Economic Indicators) Section 1 contains errors in columns 1 and 2 and should therefore not be used.

Correct data are available on request from the Merchandising and Services Division, DBS. Complete revisions will be published in the April issue of this Review.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section I are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for Selected Economic Indicators, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

* * * * *

SYMBOLS

The following standard symbols are used in this and other DBS publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero.
- amount too small to be expressed.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

MCD months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 7—Exports and Imports

The seasonally adjusted data for exports and imports, by countries, have been revised for the years 1969 and 1970.

Section 3, Table 3.1—Financial Flows Matrix

Supplementary tables covering revisions for the third quarter 1969, nine months ended September 30th, 1969 and 1970, were published in the March issue of this Review.

Section 10, Table 1—Retail Trade

Revisions of Retail Trade series adjusted and unadjusted listed below have been incorporated in this issue of the Canadian Statistical Review:

- (a) Total all trades—1968, 69, 70
- (b) General merchandise—1968, 69, 70
- (c) General stores—1970
- (d) Furniture, T.V., radio and appliances—1970
- (e) All other trades—1970

and the following provincial data:

| | | | |
|----------------------|--------------|------------------|--------------|
| Newfoundland | 1968, 69, 70 | Ontario | 1968, 69, 70 |
| Prince Edward Island | 1970 | Manitoba | 1968, 69, 70 |
| Nova Scotia | 1968, 69, 70 | Saskatchewan | 1968, 69, 70 |
| New Brunswick | 1970 | Alberta | 1970 |
| Quebec | 1968, 69, 70 | British Columbia | 1970 |

Section 10, Table 6—Consumer Credit

A significant change has been made in the preparation of figures for Installment Financing and Other Personal Cash Loans. Beginning with the January 1971 figures, these outstanding balances do not include interest and other unearned income finance charges, and are not directly comparable to the corresponding 1970 figures. Examination of reports for December 1970 showed that elimination of unearned income reduced outstandings of installment financing by 13.5 per cent and of large personal loans by 16.5 per cent. Corresponding breaks exist in the Sub-total and Total columns.

Section 13, Table 4—Cheques Cashed in Clearing Centres

Revisions to seasonally adjusted series in this table reflect the incorporation of data for 1970. For some series revisions have been extended back to January 1966.

Section 13, Table 5—Life Insurance Sales

Only 1969 data have been revised. The total sales figure does not include sales for Northwest Territories.

THE 1971 CENSUS — AN OVERVIEW

W.D. Porter*

Tuesday, June 1, 1971 will mark the hundredth anniversary of census-taking in this country since Canada became a nation. Appropriately, the passing of this important milestone will be marked by the introduction of new techniques for both gathering and processing census data.

For the first time in history, self-enumeration will be employed for about 97 per cent of the population. By delivering printed questionnaires to each household, it is expected that the quality of the results will be improved through reduction in errors caused by response variance, which represents a major source of error arising in traditional canvasser-respondent question and answer interviews.

Population and housing questionnaires can be answered for the most part by blacking in small circles with a pencil. The completed questionnaires (after initial checking and coding operations) will be photographed on microfilm by high-speed automatic cameras and the data transferred directly to computer tape by an ingenious machine called FOSDIC (Film Optical Sensing Device for Input to Computers).

The new collection and processing techniques, coupled with much more intensive use of sampling, are expected to produce more statistical data of a higher quality than ever before, with accompanying improvements in the timeliness of publication.

The new techniques were described briefly by the Hon. Jean-Luc Pepin, Minister of Industry, Trade and Commerce, in an announcement issued in Ottawa last September 22. News media in general reacted favourably to these aspects of the forthcoming census. Such reactions, following the successful results of extensive field tests, indicate reasonable grounds for the belief that the procedures will be readily accepted by householders. It is important that wide acceptance of the methodology be attained, since the new "do-it-yourself" techniques require a greater degree of participation in the collection process on the part of the public than did the traditional canvasser methods.

Meeting Modern-day Needs

The increasingly complex problems of modern-day planning, administration and research, in both the public and private sectors, have led to a substantial escalation in the demand for information. Regional development planning, urban renewal projects, education and manpower programmes, poverty and welfare assistance measures, and market research analysis are some of the fields in which increasing needs of users have been articulated and evaluated during the planning stages for the 1971 Census.

The Census of Canada today has far wider uses and applications than its original purpose of apportioning electoral representation. Its importance

hinges on its role as an inventory of the people — their numbers and local distribution, age and sex, language, ethnic and religious composition, educational attainment, occupational and industrial employment, income levels, housing and agricultural conditions.

These facts are not only vital in themselves but become especially significant when derived from a census which permits their analysis in relation to one another, and when viewed against the background of history and natural environment. Census data form a standard by which other indicators relating to the nation's well-being can be measured with real meaning (e.g. birth and death rates, criminality, production, trade, wealth, unemployment, migration). Of critical significance are the uses made of the census results in the development of plans and the formulation of social and economic policy by government departments and the business community.

The average Canadian householder, of course, can hardly be expected to appreciate the real value of his contribution to the vast store of significant information collected in a census. To most people, the intangible benefits arising from the process which develops information about a certain individual or family into aggregate statistical data which are then used as a basis for decisions involving millions of dollars are simply too remote to be appreciated. Nevertheless, the Canadian people have always shown a remarkable willingness to co-operate in the taking of decennial and quinquennial censuses.

The Historical Background

Canada has a rich and notable history in the field of census-taking. It dates back to 1666, when the world's first census in nearly a thousand years was taken in what is now Canada, but was then New France and Acadia.

Before that event took place, the process of census-taking had evolved over a long period, dating back almost to 4000 B.C. That is when, records indicate, the Sumerian city states in the area of ancient Babylon began to take inventories of people, property and livestock.

There are records of censuses of a kind in China about 3000 B.C. and in Egypt about 2200 B.C. The Egyptians influenced the Hebrews and the Old Testament carries several references to the head counts of the time. The Greeks and Romans also took censuses.

In those ancient days, the primary purpose of taking a census was to collect taxes. But governments of the day also found it a useful means of

* W.D. Porter, Director, Census Division, DBS.

ear-marking young men eligible for conscription into their armies and identifying others available for forced labour.

It was not until the Roman Empire began its ascendancy in the Mediterranean that the census became a systematic and methodical procedure. The Romans quickly became the most consistent and skilful practitioners of the art, making frequent and regular use of the census for hundreds of years.

Counting heads and tax resources as methodically as they built their highways, the emperors of Rome were able to develop military might to the point where their armies were invincible and their treasuries ample to support them.

But when the Empire finally collapsed about 600 A.D., the census fell into disuse and, ultimately, total oblivion, from which it was not rescued for another thousand years. In the whole period between 600 and 1600 A.D., only two instances of census-taking on any scale are recorded. And both were unique projects, never repeated.

One was the compilation of the Breviary of Charlemagne in 808 and the other, the famous Domesday Book prepared on William the Conqueror's orders in 1086.

The Encyclopedia Britannica credits what is now Canada as being the site of the first effort since Roman days to take a regular census in an area larger than a single city. Jean Talon, the Great Intendant, organized a census of New France (Quebec) in 1666 and, five years later, repeated the process in Acadia (Nova Scotia). (There were also censuses in 1667 and 1668 of New France.)

Talon's first census listed 3,215 persons, with details of age, sex, marital status and occupation. In 1667, additional questions were asked about livestock and property under cultivation. Thus was born the modern idea of a population census as a means of providing information about the structure of the society, rather than seeking to identify and control individuals. Fifteen censuses of New France and nine of Acadia were taken between 1666 and 1754. Questions were added with each new census, going into such matters as crops, livestock, buildings, churches, grist mills, sawmills, firearms and swords.

Britain's oldest colony, Newfoundland, took its first census in 1687, followed by five more in the next 24 years. Nova Scotia took its own censuses under its new name from 1762 to 1851.

Quebec continued to take a regular inventory of its human and economic resources throughout the 18th and 19th centuries, holding six censuses between 1753 and 1831. Ontario did not take its first census until 1824, but evidently set out to make up for lost time by repeating the process annually for 18 years.

Meanwhile, New Brunswick in 1824, Assiniboia (later to become Manitoba) in 1831, and Prince Edward Island, in 1841, joined the ranks of British colonies in North America to adopt the census as an instrument of government.

The first "Canadian Census Act" was passed in 1841, at the time of the Union of Upper and Lower Canada, providing for a census of Upper Canada "in 1841 and in every fifth year thereafter". Lower Canada was added to the census area by another piece of legislation in 1843.

In 1870, the district of Assiniboia became the province of Manitoba by joining Confederation. Earlier that year it conducted its last census but used its new name. British Columbia took its first census in 1871, a year before entering Confederation.

Arrangements could not be made to include the new provinces in the first national census of 1871, but they were part of the 1881 Census, as was Prince Edward Island, which acquired provincial status in 1873.

Alberta and Saskatchewan became the eighth and ninth provinces in 1905, created out of the vast sweep of land known as the Northwest Territories. Normally, they would not have been included in a census until 1911, but a change in federal government policy brought them into the statistical picture five years ahead of schedule.

The west was growing rapidly at the turn of the century, as a result of large-scale immigration (2.9 million immigrants between 1901 and 1914) and a steady tide of migration from the eastern provinces. In 1896, the government decided that a farm and population census of Manitoba might help to measure the changes that were taking place at such high speed.

In 1906, this census was broadened to include the two new Prairie Provinces. It was called a quinquennial census, because it fell five years after one decennial census and five years before the next.

For the next 40 years, the Prairie Census served a valuable purpose. The population picture in the western provinces was changing so rapidly that census information had to be updated twice as often as in the rest of the country.

By 1956, however, this was no longer true. The special need for Prairie censuses had disappeared. Growth rates had become stabilized and, indeed, the pendulum was swinging the other way.

But the value of updating population figures every five years had become apparent to all users of census information. In response to their pleading, the government extended the quinquennial census of 1956 to embrace the whole country. The process was repeated in 1966 and has now become a permanent element of the Canadian statistical system.

SMALL-AREA INCOME ESTIMATES, 1966

H.E. Alter*

Summary

Aggregate income of individuals residing in small subprovincial areas has been estimated for the year 1966. The income concept used for this series has been defined as "money income". The term "small-area" refers to counties or census divisions.

After a brief review concerning the need for small-area income data, "money income" and other income concepts are dealt with in detail. A comparison between "money income" and "personal income" is then carried out. The choice of using counties or census divisions as appropriate spatial units is also discussed in the wider context of "economic regions". These somewhat peripheral remarks are rounded out with a description of data sources employed in the production of small-area income estimates. Special emphasis is placed on data from income tax returns.

The key section of this article contains an overview on methods of estimation used to produce small-area income data. These methods may be summarized as component adjustment and allocation. Although this discussion is fairly brief, it covers almost all aspects of the estimating process. It is also pointed out in this article that a technical paper dealing with all methodological aspects surrounding this series will be published later, along with estimates subsequent to 1966.

The final section of this article deals with plans for the future, as far as small-area income estimates are concerned.

The appendix contains the data and a brief note concerning the grouping of counties. The note also cautions against the conversion of these data into per capita income.

A Need for Data

As early as 1965, the Economic Council of Canada deplored the lack of data for subprovincial areas. At that time the Council attempted to justify its choice of regions which were based on the delineation of provincial boundaries. It admitted that an insufficient data base would prevent its analysing aspects of subprovincial impact. On the other hand, the Council pointed out that provincial governments could be expected to have a vital interest in data pertaining to areas dividing their particular jurisdictions and it stated specifically that

... subregions can of course be clearly distinguished within the provinces. This is particularly true of the larger ones, which have substantial populations and marked internal economic and geographic differences. Although appropriate balance among these subprovincial regions and the related problems of decentralization are primarily the concern of the provincial authorities, the implications and interactions of broad national

policies and programmes may also prove to be of great importance. Our studies in the field of regional development, however, have not been specifically extended to these issues. It is also recognized that for certain programmes and research purposes, **subregions** which cut across provincial boundaries **can be usefully considered**. The statistical information for this kind of analysis, unfortunately, **is seriously deficient**.¹

Undoubtedly, this deficiency was noticed by researchers and policy-makers who had to grapple with aspects of regional disparity. Some data, which were readily available, such as data from taxation statistics, provided reasonable first approximations, but needed refinement in order to enhance their usefulness to the policy-maker and administrator.

The Dominion Bureau of Statistics prepared a feasibility study as early as 1956 in order to bring about the production of data on a subprovincial basis.² This study was confined to ten economic regions in each of the provinces of Ontario and Quebec. "Regions were defined so as to include only whole census divisions . . . and were further constrained so as not to cross provincial boundaries . . .".³

While this study outlined possible methods of producing income estimates for economic regions within provinces, it did not encourage any attempt to produce county data. Moreover, it remained silent on expected problems in the Atlantic Provinces and other parts of Canada.

Although the report was couched in optimistic terms, a number of obstacles apparently prevented its being translated into action soon after its release. Eventually, a growing need combined with improved data sources and advanced retrieval systems brought about a new approach to the problem of estimating income for small areas.

With the modification of the sampling design for the 1966 taxation year, income data published annually by the Department of National Revenue in *Taxation Statistics*⁴ became a primary target for investigating the feasibility of producing small-area income estimates, i.e., income estimates by county or census division. However, income as reflected in taxation statistics is not all-inclusive. There are certain types of income which are not subject to taxation, and aspects related to this limitation will be discussed in greater detail in the following sections.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts, Fourth Quarter 1970 (D. B. S. 13-001).

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts, Fourth Quarter 1970 (D. B. S. 13-001).

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance.

²Excludes the refundable tax on corporate cash profits introduced May 1966. Refunding of the tax began in the third quarter 1968. ³Withholding taxes.

⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹See footnote 1, table 3. Labour force obtained as the sum of employed and unemployed from tables 5 and 7. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force, (71-001) D. B. S.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total manufacturing inventory owned by manufacturers including warehouse stocks. ³Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ⁴Annual figures for inventories and unfilled orders are end of December values.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

Table 3: manufacturing inventories¹ by industry based on the 1960 standard industrial classification (million dollars)

| end of year or month | total inventories owned | non- durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ²100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), D.B.S.; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), D. B. S.

¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentones plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D. B. S.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and cammingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane cammingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.

¹Monthly totals are not equivalent to annual data which include Newfoundland and Yukon and Northwest Territories for which only annual statistics are collected. ²Planks and boards, flooring and square timber. ³Hollow blocks including fireproofing and load-bearing tile. ⁴For building insulation only.

⁵Figures cover the production of firms which normally account for 90 per cent of the total for Canada. ⁶Factory sales of firms which normally account for 96% of total Canadian production.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of NFLD. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs. ¹As at end of period. Last month is preliminary. ²Milk equivalents of cottage cheese are not included in the monthly figures but are included in the monthly averages. ³Includes butter and cheese imported and in (railway) transit through June 30, 1968. ⁴Exclusive of Newfoundland; includes hatching eggs. ⁵Includes case and bulk. Sources: Dairy Factory Production (32-002), Dairy Review (23-001), Stocks of Dairy and Poultry Products (32-009), Production of Eggs (23-003), D. B. S.

¹Monthly totals for current years are not equivalent to annual data due to receipt of additional statistics which cannot be allocated by months. ²Includes also seaweeds and other species such as whales, worms etc.

³Exports include sea and freshwater fish and shellfish products but exclude bait, meal, oils, offal, livers, fish roe n.e.s. and fishery foods and feeds n.e.s. ⁴Total holdings (all forms) of frozen fish commencing October 1969 excludes freshwater species.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, wieners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), D. B. S.

¹Department store stocks at end of period at selling value. The sales and stocks data are revised series based on the results of the 1961 Census of Merchandising and Service Establishments. ²Due to changes in definition of department stores and the introduction of general merchandise stores, formerly included in all other stores, the 1968, 1969 and 1970 figures are not comparable with the data of previous years. Source: Department Store Sales and Stocks (63-002), D. B. S.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁵ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁶ The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are repeated in the unadjusted form. ⁷ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Installment financing components do not include interest and other unearned income finance charges. ¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), D. B. S.

¹Column numbers refer to tables 3 and 4, section 11. ²Includes special transaction-trade, not shown separately. ³Includes scrap. ⁴The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁵Same series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), D. B. S.

¹Monthly averages for 1968 and 1969 may differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ³Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, D.B.S.

¹Monthly averages for years 1967 and 1968 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. These groups covered all air carriers with gross annual flying revenues of over \$100,000 prior to January 1969 and over \$150,000 during 1969. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 95 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ³United States and other foreign carriers having scheduled services into and out of Canada. Excludes passengers in transit through Canada. ⁴Cargo includes air freight and express but excludes mail and excess baggage. Source: Civil Aviation (51-001), D.B.S.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are far producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans advances and investments. ²Under the Technical and Vocational Training Assistance Act. ³Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁴Includes treatment and rehabilitation services. ⁵For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capitol Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ⁶As of April 1, 1969 Industry and Trade and Commerce are combined.

TECHNICAL NOTE - REAL DOMESTIC PRODUCT

Section 3, Tables 2.1-2.3

The indexes published in Section 3, Tables 2.1, 2.2 and 2.3 present revised estimates of Real Domestic Product (RDP) by industry. These estimates have been published for the 1961-69 period on an annual and sub-annual basis in *Indexes of Real Domestic Product by Industry, 1961-69, 1961=100*, DBS Catalogue No. 61-510, released on February 11, 1961. The new monthly index of RDP (including the monthly Index of Industrial Production), which has been featured in Section 1 tables for the past months, is now shown in more detail in Table 2.1 of Section 3. With minor exceptions, the concepts and general methodology remain as outlined in previous reference papers.¹ The 1960 S.I.C.² continued to be used.

The main features of the revision are: the adoption of revised 1961 industry weights based on the final Gross Domestic Product at factor cost distribution, the incorporation into the system of improved and up-to-date annual index levels using the latest annual and quinquennial census informa-

tion; improvements to the monthly indicators; extension of the total activity concept to manufacturing, mining and forestry, and the inclusion of depreciation estimates in the output measures for the non-commercial industries.

An updated description of concepts, methods and data sources for the Real Domestic Product system will be published in a separate reference document later this year. No further major revisions to the RDP indexes are contemplated until conversion of the system to a new (1971) weight and reference base.

Aside from the revisions, the single most important development is the introduction of monthly indexes for Real Domestic Product (the Index of Industrial Production component is available on a monthly basis back to 1919) for the entire period from 1961 to date. Thus, approximately 120 individual industry indexes are now available each month in DBS Catalogue No. 61-005.

The revised indexes replace the previously-published record for the period beginning in 1961, contained in *Indexes of Real Domestic Product by Industry (1961 Base)*, DBS Catalogue No. 61-506, in the monthly *Index of Industrial Production*, DBS Catalogue No. 61-005, and previous issues of the CSR.

Content of Questionnaires

The number and nature of questions asked in the decennial census have changed over the years to meet changing needs for information. Starting several years before every census, planning committees meet with representatives of other federal departments and agencies and receive submissions from provincial statistical agencies and groups representing the business and agricultural communities, universities, town planning experts and other users of census data. Census questions are then developed to meet the most vital information needs.

For example, it was not until 1901 that residents born outside Canada were asked when they immigrated and their country of citizenship. This was a direct result of the rising tide of new arrivals during the last decade of the 19th century.

Questions are also dropped when they cease to have relevancy. The 1931 Census, accordingly, was the last in which people were asked whether they could read and write. The illiteracy rate was so low by then that the 1941 Census turned its attention to the number of years of schooling and other more meaningful educational data.

On the other hand, it was not until 1941 that the census began to concern itself in detail with information about housing, and every housing question on the 1971 Questionnaire was first asked in that year or later.

Decisions to include or exclude proposed questions in the 1971 Census were based on such factors as: (a) the value of the information a question judged to be in the national interest could be expected to produce; (b) relative costs; (c) the ease or difficulty of obtaining reliable data; and (d) respondent work loads and tolerance.

The evidence available from some three years investigation of user needs along with evaluations through field testing programmes indicates that the 1971 Questionnaire content represents a judicious balancing of the essential criteria; it will satisfy the needs of an increasing number of users without imposing an unacceptable burden on respondents.

Population and Housing. — Changes in the questions from the previous 1961 Censuses of Population and Housing that have been recommended for 1971 result mainly from demands for more detail within existing subject fields. Education questions have been expanded to include vocational and occupational courses; net income of persons operating farms has been added to round out the income picture; a question on language commonly spoken, recommended by the B and B Commission, has been added to those on mother tongue and official language; transportation agencies and town planners have effectively argued for inclusion of a question on address of place of work to determine relationships between where people work and where they live. Additional questions have been included on rent, fuel used, and vacation homes.

Agriculture. — The Census of Agriculture is taken at the same time as the Censuses of Population and Housing. Questionnaire planning for the 1971 Census of Agriculture began in 1967 with the formation of a federal interdepartmental committee. During early 1968, meetings were held with provincial representatives in each province, with university users, with the federal Department of Agriculture, and with the Statistical Committee of the Farm Equipment Institute. Recommendations were reviewed by the interdepartmental committee and the resulting questionnaire was field-tested in October 1968.

In the 1971 Census of Agriculture, one general questionnaire is planned to replace the four questionnaires used in 1961. Irrigation questions and questions on forest products (on a reduced basis) form part of the general questionnaire for 1971. New questions relate to the use of fertilizers and sprays, and to the classification of the part-time work of farm operators by kind of work done. Additional items of farm machinery and equipment are included in the appropriate questions.

The questionnaire on non-farm holdings is being dropped since their importance is now negligible. In summary, farm operators will have approximately the same number of agricultural questions to answer in 1971 as in the preceding decennial census.

General Methodology

The development of the proposed methodology for the 1971 Census received its initial impetus from the evaluation of the quality of the 1961 Census and from the study of similar international experience, particularly in the United States. This research identified several important sources of error to which census statistics are subject. Respondents may inadvertently or deliberately provide erroneous information. Canvassers may influence answers in a number of damaging ways. Additional errors are possible at the data processing stage. The studies indicated that by far the largest reduction in error could be expected if the role of the respondent in the data collection process was increased, by eliminating in so far as possible the traditional "quick interview" approach.

Development of "Self-enumeration" Techniques

From the foregoing studies, it became an objective of the 1971 testing programme to develop methods that would minimize the use of the canvasser interview technique. These methods, involving self-enumeration, have several variations, but a common goal is to have each adult member of every household answer the census questions pertaining to himself, and where necessary to consult relevant records. Households or persons who do not answer the census questions or who make significant omissions are contacted by telephone or canvassed by a Census Representative. Thus, the latter field employee has still a most important role to play in

assuring complete coverage, in checking completed questionnaires for accuracy and consistency, and in following up respondents to correct deficient records.

The "do-it-yourself" technique of enumeration is preferable to the traditional method where the canvasser must ask, interpret and record quick answers to intricate questions, given for all members of the household by any responsible member who happens to be found at home.

A small proportion of the population cannot, however, be covered by self-enumeration techniques. These include for example, the people in the vast northern regions, the coastal outports, institutions, and military barracks, all of which present special problems requiring traditional canvasser methods.

Field Testing Programme

To investigate the merits of various field methods for the 1971 Census, a series of census field tests were designed, starting with a small pre-test in Ottawa in December 1966, followed by a complete test enumeration of the city of London in September 1967, a test of 6,000 households in Toronto in June 1968, and a rural test in four representative localities across Canada in October 1968.

Two of the tests assessed the advantages of self-enumeration, with questionnaires mailed to all householders for their completion and returned by mail to a central processing office. In the rural test, a combination of the traditional interview method and enumerator "drop-off" and "pick-up" of questionnaires was employed.

Response rates in these various field tests indicated the feasibility of employing self-enumeration techniques. A Trial Census, or full-scale dress-rehearsal was held in September 1969 in three localities: Sherbrooke, Quebec, St. Catharines, Ontario and the rural areas around Souris, Manitoba. As a result of this intensive testing programme, field plans for the 1971 Census call for a system of "drop-off" of self-enumeration questionnaires by Census Representatives to the householders for their completion and "mail-back", to be employed in the larger urban centres. In smaller centres and rural areas, the Census Representatives will drop off the questionnaires (including agriculture, where applicable) but instead of the mail-back procedures, they will return to pick up the completed forms.

The Use of Sampling

The introduction of extensive sampling in 1971, combined with self-enumeration, appears to offer the best combination to achieve the basic aims of the census in terms of cost, quality, and timeliness of the data. The field methods have, as a main objective, the production of data of higher quality through the use of self-enumeration techniques. Sampling is an essential technique in reducing the burden on the respondent. There have been strong

pressures to expand the range of inquiry of the census. Without sampling, the additional questions could not have been included in the 1971 Census, partly because of the response burden which would be imposed on the public.

Sampling has been used as a census-taking technique in Canada since 1941. At that time, its use was restricted to the collection of housing data and a sampling ratio of 10 per cent was employed. The procedure proved to be effective and was extended to a 20 per cent ratio in 1951 to provide additional geographical detail. In 1961, its use was further extended to a few population questions, and a sample of 20 per cent of households was asked additional questions about income, migration and fertility.

A major extension of this technique will be used in the 1971 Census. A great deal of intensive investigation of the relative costs and benefits of alternative sampling ratios for different combinations of questions preceded the final decision to recommend a 33 1/3 per cent sample for all but the basic questions. A "short" questionnaire, containing just 6 basic population questions, to be answered by everyone, and 9 housing questions to be answered by household heads, will be completed in two thirds of all households in Canada. A "long" questionnaire containing the same 15 basic questions, plus 20 housing, and some 50 socio-economic population items will be answered by the remaining one third of Canadian households. Thus, compared to the 1961 Census, two thirds of all households are being asked substantially fewer questions (averaging 9 per person as compared to 20 in 1961), and only one-third are asked significantly more questions (averaging 48 per person as compared to 36 in 1961). The more extensive use of sampling is not expected to reduce the availability of 1971 Census statistics as compared to 1961, for either small geographic areas or detailed cross-classifications.

The degree to which sampling is employed is directly related to the reduction of costs and to the production of more timely results. By reducing the editing and processing work load, sampling should make a major contribution to the timely release of census results. Sampling will contribute to error, particularly for tabulation "cells" with very small numbers of observations, but the reduction in error through self-enumeration is expected to be greater. The objective is to minimize total error, at acceptable cost. Small numbers—five, ten or even fifteen—contained in census tabulations have significant error associated with them. The error contributed by sampling will not make results any less acceptable than the results from 100 per cent coverage. Even where the data are found by the user to be inadequate, they will frequently be sufficient to indicate problem areas and the need for more intensive survey information.

By its nature, the census is a multi-purpose information medium and, as such, cannot provide a sufficient depth of data for many particular purposes. This is one of the important reasons that

DBS is planning to expand its survey capability to meet special information requirements that cannot be satisfied by census statistics.

Data Access and Dissemination of Results

Plans have been made to improve the effectiveness of the storage and retrieval of census data substantially over 1961 and 1966. The computer technology which is available for the 1971 Census has far greater capability than that of earlier censuses, and the computer experience of 1961 and 1966 is being incorporated into the systems design, and the software and hardware plans for 1971.

Two new developments in computer technology, together with the design of the questionnaire itself, should speed the processing of census data.

Most questions are answered by filling in small circles, transforming them into black dots. When the questionnaires are returned to Census Headquarters, they will be photographed on microfilm.

An ingenious machine will feed questionnaires, one at a time, onto a photographic table, turning the pages automatically until each has been photographed by a high-speed camera poised directly overhead. The machine will feed and photograph an average of 120 questionnaire pages per minute.

Twelve such cameras will transform the 6,000,000 questionnaires into about 16,000 rolls of microfilm, each roll containing up to 3,600 questionnaire pages.

When the film has been developed, it will be a photographic negative. The black dots made by filling the circles will become transparent dots on a generally black background. In effect, they will be tiny windows in an otherwise opaque film.

The negative microfilm will then be fed through another machine, known as FOSDIC (Film Optical Sensing Device for Input to Computers). At a rate of about 450 pages a minute, the film passes through FOSDIC, to be scanned by a beam of light. The beam passes through the film wherever it finds a transparent dot and records the information on computer tape.

From the computer tapes, the data are transferred to the computer's memory core. This memory may be likened to a series of pigeon-holes, each receiving one kind of fact and at the same time keeping a running total of the items. In this way the computer builds up cells of facts about such items as age groups, places of residence, vocational training, income, education and so on.

Under instruction by a programmer, the computer can reach into several pigeon-holes at the same time—for example, those concerning groups

between 10 and 20 years of age, within any city or any section of a city, by sex and mother tongue. It can thus relate total numbers by geographic location, by years of schooling, training skills, language and many other characteristics, in an almost infinite number of combinations.

The information can be retrieved in the form of printouts or computer tapes containing the various tabulations outlined by Census Division experts. Census data can also be retrieved by province, electoral district, county, metropolitan area, city or section of a city.

The only data that cannot be fed into the computer, and therefore can never come out of it, are the names or any other information that could identify individual respondents.

Moreover, if the tabulation of a very small area is likely to identify any single person or family, that tabulation will not be published, but will be grouped with others in adjacent sections of the city or town to maintain the confidentiality of the information.

The new methods and procedures will extend the range and volume of tabulations available for users. Close attention has been given to the development of working arrangements with provincial governments and other major groups to ensure efficient access to census data through more extensive and comprehensive use of users-oriented, automated files.

The extended capabilities of computer technology are also being used for the benefit of the continually increasing number of census data users by providing a wide and diversified range of special tabulations by means of computer storage and retrieval programmes. These include the DBS Geographically Referenced Data Storage and Retrieval System (GRDSR or Geocoding) and CASPER. The geocoding system, under development, is expected to provide rapid and economical access for users requiring special tabulations for non-standard types of areas.

An important development to users of agricultural data is the linkage of the population and agriculture questionnaires for the first time to provide population data regarding farm people against the background of the characteristics of their farms. For example, information regarding age, education, source of income, etc., of the operators of small holdings will provide data useful to the planning and administration of rural poverty programmes.

Special literature, catalogues and manuals on census data access will be prepared in order to ease and increase the effective utilization of the vast potential of the 1971 Census data.

(Continued from page 6) •

Small Area Income Estimates, 1966 - Continued

At this stage it seems appropriate to deal with the income concept which was used for small-area income estimates. Once concepts have been clarified, a few words will be said about the choice of geographical subdivisions, and this section will be followed by a discussion of data sources. These sections should contribute to a better understanding of the methods of estimation, which constitute the point of primary interest as far as this article is concerned. The following section will now turn to income concepts.

Income Concepts

To meet users' needs, a number of income concepts have been developed by the Dominion Bureau of Statistics. The concept to be used may depend upon the type of analysis to be conducted, but it may also emanate from features inherent in the data base. Examples of income concepts are "employment income" and "earnings". Both are used in conjunction with labour force data. "Employment income" is related to the total labour force, whereas "earnings" should be used in combination with wage and salary earners; or to put it in a negative way, "earnings" usually exclude the income of self-employed members of the labour force. "Personal income" is a widely used concept. It is a National Accounts concept and refers to the income accruing to the personal sector. "Personal disposable income" on the other hand is "personal income less taxes". The income concept used for producing small-area income estimates is **money income**.

Money income is a before-tax concept. The corresponding after-tax concept would be "disposable money income". A before-tax concept had to be used because of data limitations. The withdrawal of tax from incomes, as estimated for small subprovincial areas, poses a number of difficulties for the Province of Quebec. Data on provincial taxes are not available for small areas in that province, and special methods of estimation will have to be developed if a series in terms of "disposable money income" is desired.

One may now ask what is money income? In summary, it consists of income from employment, from income-yielding assets, such as interest or dividends, and also income from government transfer payments as made under income maintenance programs by all levels of government. Money income excludes receipts from the sale of assets, refunds on disbursements or repayments of loans. It also excludes "windfall gains" and capital gains. Moreover, money income does not include income in kind.

In order to discuss this exclusion, a few words will have to be said about the analytical value of money income, and once this aspect has been elucidated, more will be said about income in kind. Only then will the discussion return to money income and its components, and it will be followed by a comparison of money income and personal income.

Money income is intended to measure purchasing power. It can be used to explain the propensity of individuals to save and to consume. Ideally, "disposable money income" should be used, but the development of a money-income series on a before-tax basis is the first step in this direction.

While consumption expenditures and private savings are linked to the amounts of money available, they are not a perfect measure of "welfare". Wealth, for example, has definite welfare connotations. This aspect, however, will not be explored any further.

"Income in kind" must also be included in any discussion on welfare, but it does not increase the purchasing power of individuals. An example may help to illustrate this point. If an individual or family has a certain amount of money income, say \$5,000, it can decide how much to spend and how much to save. In one form or another, this money will be pumped back into the economy. Let us now assume a second individual or family with identical attributes to the first one has the same amount of income, but has a plot of land on which to grow vegetables and perhaps some fruit for home consumption. In terms of "welfare"; the second member is better off than the first one, but the amount of money returned to the economy either through consumption expenditures, or saving and consequently investment, remains identical for both.⁵

Apart from the fact that the exclusion of "income in kind" from "money income" yields a better measure of potential purchasing power, "income in kind" is difficult to estimate or impute. How does one value "income in kind" from home-grown produce? At wholesale or at retail prices? If this question can be answered, at what price level? There may be a prevailing local price level, a national price, annual average price etc. The problem becomes even more involved if "income in kind" is derived from free room and board, free transportation, etc. At one end of the spectrum, these services may be poor substitutes for commercially available services, and at the other end they may have no substitute at the local level. Thus, any value attached to such a service would be highly arbitrary. To illustrate this point another question shall be posed. How would one value free room and board in a remote lumber camp or at an arctic drilling site, since there are no commercial substitutes available?

While these problems supposedly have been solved by those who have to impute a value for these types of services, the adequacy and usefulness of such a measure for comparative welfare analysis remains doubtful. Thus, technical limitations in placing a value on "income in kind" and

⁵ It is assumed that hoarding of money does not take place, and that all saving is carried out in institutions, such as banks, where the money is available to investors; it is also assumed that all savings will go to investments.

analytical constraints imposed by the emphasis on potential purchasing power led to the concept of **money income** when small-area income estimates were developed.

To clarify the concept even further, "money income" will now be decomposed into its constituent parts. One can think of two major components, namely **employment** and **non-employment** income. **Employment income** consists of wages and salaries and commission income earned on jobs carrying a basic wage or salary. It also includes military pay and allowances. Non-farm self-employment income is another subdivision of employment income and consists of business income as obtained by individuals from unincorporated businesses, and also professional income; e.g., that of lawyers, physicians and others. Moreover, it includes commission net income which accrues to self-employed people working exclusively on commission. Finally, income from self-employment as a farmer completes the description of employment income components.

Non-employment income can be divided into investment income, such as bond and bank interest, dividends, mortgage interest etc., and a large number of miscellaneous items. Rental income, alimony, old-age pension and superannuation are some of the non-employment income components which are subject to taxation. Others, such as workmen's compensation, unemployment insurance benefits, family and youth allowances, as well as numerous provincial and municipal welfare payments are not subject to taxation, but form part of the non-employment income component of money income.

Personal income, as used for National Accounts purposes, and **money income** will now be compared and contrasted from a conceptual point of view. Personal income does contain a number of imputed income items, whereas money income does not. Money income is aggregated from the income of individual recipients, whereas personal income is related to the **personal sector** of the economy; i.e., a sector that includes certain institutions which serve individuals. Income received by these institutions is thought of as being an indirect form of income of individuals; e.g., a grant to universities relieves the student population from paying a certain amount of tuition fees. One can also state it differently. The transfer payment could have been made to the student, who in turn would have used this form of income to "purchase" education. Similar reasoning prevailed with respect to grants to hospitals, although hospitals have been removed from the personal sector in the meantime.⁶ However, when the small-area income project was started, the old concept of "personal income" was still in use. It included income accruing to "all persons and all private organizations which are not established for the purpose of making a profit; e.g., charitable institutions, municipal hospitals, and universities. Private pension funds are also included in this sector".⁷ It is this concept which was used in the comparison between personal income and money income in Table 1.

² As developed by DBS, discussed and published in this article and appendix thereto.

³ Exclusive of Yukon, Northwest Territories, and income accruing to Canadians residing abroad.

In terms of Canadian aggregates, which have been confined to the ten provinces, money income remains almost 10.0 per cent below personal income. At the provincial level, money income deviates from personal income by as much as 21.4 per cent in Saskatchewan, and by as little as 6.3 per cent in Ontario. The percentage deviation on the national level does not exceed 10.0 per cent, since large percentage deviations are associated with relatively small income aggregates, and since provinces with large aggregates show a relatively small percentage deviation.

Table 1 is neither intended to help explain the reason for the differences between personal and money income, nor is it intended to open a discussion on possible causes for differences between provincial deviations. It can only serve one purpose, namely to illustrate the magnitude of the income difference based on these two concepts, either on a provincial or Canadian basis. Furthermore, it can show that personal income is consistently larger than money income, because personal income contains imputed income items as well as income accruing to institutions considered part of the personal sector.

The discussion of income concepts in general and of money income in particular is now completed. The following section will deal with the choice of geographic entities for which aggregate money income has been estimated.

Choice of Geographic Divisions

Small-area income estimates were prepared for counties or census divisions. These are subprovincial areas which have administrative significance in Prince Edward Island, Nova Scotia, New Brunswick, Quebec, and Ontario, where they are called counties. The remaining provinces either have no county system, or it is too unwieldy to be used for statistical purposes.

Census divisions have been created in order to facilitate the compilation of data for subprovincial areas in Newfoundland, Manitoba, Saskatchewan, Alberta and British Columbia. The Dominion Bureau of Statistics has published some census results as well as other data by county or census division. These subprovincial areas constitute the smallest unit for which the publication of data is feasible. Feasibility is dictated by sample size and cross-classification of the data, and also by elements of continuity over time. Considering these aspects, the county or census division was the logical choice for these income estimates.

Another choice would have been the "economic region", not to be confused with the five standard regions called Atlantic, Quebec, Ontario, Prairie, and British Columbia. The latter are provincial or supra-provincial in nature, while the former are subprovincial.

If policy decisions are intended to be directed towards subprovincial areas, as may be necessary for federal policy-makers, and as undoubtedly is the case for provincial policy-makers, the choice of subprovincial areas must be as meaningful as possible. Subprovincial "economic regions" are not widely used, and where used, are defined in such a way that their boundaries cannot always be adapted to regions delineated for statistical or administrative purposes.

As a descriptive term "economic region" can have many meanings and configurations, depending on the type of economy one wishes to analyse. Economic regions tailored towards industrial development conceivably differ from economic regions defined for agricultural or forestry purposes insofar as criteria for their delineation are concerned.

In a technical sense "economic region" refers to areas defined in the latest revision of "The Department of Defence Production Economic Regions".⁸ These regions have been adopted by some federal and provincial government agencies for purposes of sampling. However, these regions have not been used extensively for purposes of publishing or analysing data.

Some provincial governments have defined economic regions specifically for their own policy purposes. In order to obtain statistics for such regions, data either have to be "customized", or they have to be produced for relatively small spatial units, which in turn can be added to conform to larger subprovincial areas. This is the idea of the "building block".

While the idea is sound, it has practical limitations. No building block will fit precisely into the construct formed by the boundaries of such regions, unless one restriction is imposed upon the delineation of regions, namely prohibition of overlap of boundary lines. Such a restriction, however, would be of limited use. Economic regions can only be ephemeral. If they were to remain fixed, a developing economy would soon outgrow its regional framework.

For purposes of adaptability, consistency over time, and comparability with other series, the county or census division was chosen as the geographical area for which small-area estimates were to be produced. In most cases these spatial units are small enough to be assembled at the policy-makers convenience into units which will enable him to use these and other data in a meaningful way. In some instances, money income by county or census division should be combined into larger spatial units in order to compensate for boundary problems inherent in the data.⁹

⁸ Canada, Dominion Bureau of Statistics, *Canadian Labour Force Survey*, (Ottawa, 1965) p. 9, note 1; Appendix pp. 37-97. Catalogue No. 71-504.

⁹ Please consult the note preceding the data in the Appendix to this article.

Counties and census divisions do not cross provincial boundaries, hence provincial aggregates can be obtained by summation of county data for the province concerned. However, there are no small-area data available for the Yukon and Northwest Territories. First of all, the data base was insufficient and estimates for the Territories would have been of a spurious nature. Secondly, it had to be remembered that "the North... presents special economic and physical characteristics, all of which suggest that a special study of the area is required",¹⁰ and consequently users' needs would not be met even if reliable estimates could have been produced.

Attention will now be directed to data sources. These sources affect the method of estimation considerably, and it will be difficult to discuss one without the other. Nevertheless, the following section will emphasize sources, perhaps with casual references to methods. These, however, will be discussed in the following section where familiarity with data sources can be assumed.

Data Sources

It should not be surprising that income tax statistics constituted a major data source for the purpose of estimating small-area income, since most components of money income are subject to taxation. Other forms of income had to be obtained from administrative records of various government departments and agencies. Some of these items were available from published or unpublished DBS records, and others had to be obtained from the relevant Department directly. These statements constitute a brief overview only, and sources will be discussed in more detail in the following paragraphs.

The Department of National Revenue made three types of records available: Tabulations from the masterfile as produced for its own purposes, special tabulations from the statistical master produced especially for the purpose of estimating small-area income, and a summary of "earnings" based on employers' records. These three types of information will now be described more particularly.

The masterfile is a record of all taxfilers.¹¹ The tabulations based on this file show the number of taxfilers by county,¹² as well as total and average income for each geographical location. Moreover, income distributions are shown by location, but such distributions do not enter into any future discussion.

¹⁰ Second Annual Review *op. cit.*, p. 98, note 1.

¹¹ "Taxfiler" is defined as a person filing an income tax return irrespective of "Taxation status", which could be "taxable" or "non-taxable".

¹² More precisely, locations are identified by three-digit code, which corresponds to a county, if such county cannot be separated into a major urban component and remainder of county. Where such separation has taken place, the three-digit code identifies subcounty areas on an urban-non-urban basis, and county data have to be obtained by aggregating these subcounty units.

The "statistical master" is based on a sample drawn from all personal income tax returns, and data from this record will be called "sample data" for future reference. The sample is stratified according to a number of criteria, and the sampling ratio varies from 1:1 to 1:98. In the aggregate, the sample contains about 6 per cent of all personal income tax returns. Since slightly over 7.7 million taxfilers filed a return in 1966, the sample contained a little less than half a million returns.

To explain the difference in make-up and composition of the masterfile vis-a-vis "sample data", a brief digression into data storage is required. Space always constitutes a constraint, whether data are stored in filing cabinets, on computer tapes or on any other medium. Individual records, of course, take up little room, if few entries per record exist. The more entries per record, the more storage space is required. This, in a nutshell, is the storage problem. It also becomes a processing problem, when users attempt to extract information from the masterfile or from "sample data".

The masterfile contains many records, and to save storage space, each record has relatively few entries, i.e., the record is not very detailed as to sources of income, occupational codes and other information. The sample, with only 6.0 per cent of the masterfile records, can afford to supply more detail per record. In addition to total income, it provides information as to income components, deductions, occupational classifications, and other detail—not all of which is relevant in this context. The user of these data now faces a choice, or a dilemma. If he prefers detailed information, he has to resort to "sample data" because the masterfile lacks it. The reason for this shortcoming can be explained by a need for economizing space. On the other hand, data obtained from a sample is never as precise as information based on all records, and if the user desires precision of some sort, he may have to forego detailed exposition of records and rely on the masterfile.

Hopefully, the foregoing aspects will become clearer when methods of estimation are discussed. Let it suffice at this point, that masterfile and "sample data" serve a specific purpose. They are not necessarily substitutes, but they do complement each other.

The detail of "sample data" as required for small-area income estimates refers to income components. It will be recalled that money income, as defined for the project under discussion, is made up of components subject to taxation and not subject to taxation. Except for military pay and allowances, all money income components subject to taxation are contained in the statistical master or "sample data". Admittedly, some of these components are more reliable than others, but methodology has been devised to take care of that problem.¹³

¹³ Income components contained in the statistical master are published by province and major city in *Taxation Statistics*, (annually) *op. cit.*, in Table 5.

Locational identifiers, such as county codes, make it possible to compare and reconcile total income from the master file and from "sample data". These two sources have another thing in common; they contain information from taxfilers only. A number of recipients of low employment income, however, do not file tax returns, even if their income was subject to taxation. The Department of National Revenue compiles records on a provincial basis from employers' submissions. These records, of course, apply only to earners of wages and salaries, and recipients of commission from employment as well as military pay and allowances. If all recipients of these income components were to file a tax return, income tabulated from employers' and employees' submission would be identical. This is not the case. Hence, employer-based records, although compiled by province only, can be used to refine small-area income components based on earnings.

While National Revenue supplied the data base for income subject to taxation other forms of income had to be considered. Moreover, some forms of income, although subject to taxation, have not been reported very extensively because of the low income of the recipient, e.g., old-age pension.

Thus, old-age pension data was obtained by province from administrative records as contained on DBS worksheets. Similarly, military pay, which was omitted from the statistical master, was also obtained from DBS records by province. Moreover, auxiliary data, such as reserve forces and cadet pay, had to be obtained from estimates prepared by the Department of National Defence.

Data on farming income gathered from tax returns also falls short because many farmers do not have large enough incomes to render them taxable and to require their filing a tax return. Two DBS publications had to be employed for purposes of adjusting farm income data from taxation records. These publications are *Farm Net Income*,¹⁴ and *Corporation Taxation Statistics*.¹⁵

Sources pertaining to income which is subject to taxation are now exhausted, and sources of other forms of income will be described next. Veterans pensions and allowances were supplied by the Department of Veterans Affairs on a subprovincial basis. Moreover, this department supplied data on "population reporting war service with Allied Forces" by county or census division as well as by their own administrative subprovincial area. Thus, veterans pensions could be distributed into counties or census divisions with relative ease.

The Dominion Bureau of Statistics publishes information on unemployment insurance benefits by province, and this publication was used as a basis for incorporating this form of income into small-area income estimates.¹⁶

Workmens' compensation, family allowances and youth allowances as well as provincial and municipal transfer payments were supplied by various DBS divisions from their worksheets. All these data could be obtained by province only.

In summary, sources can be viewed as pertaining to income subject to taxation and not subject to taxation. The Department of National Revenue provided data of the first kind with the necessary locational and conceptual detail. These data were augmented with data from other sources concerning old-age pension, military pay, and farm income. Income not subject to taxation was available by province only, veterans pensions being the exception.

It will be shown in the following section how these various sources and components were adjusted and combined to yield money income by county or census division.

Adjustment and Allocation of Income

The adjustment of income data can be divided into several steps. First of all, sample components had to be adjusted in order to conform to masterfile totals. Secondly, some of these components were further manipulated on the strength of provincial benchmarks. Finally, the adjustment of taxation data was followed by an allocation of income items not subject to taxation.

All income components from "sample data" and pertaining to a particular county or census division were adjusted in such a way that their percentage share of total county income remained unchanged. The sum of all adjusted components, however, had to agree with the masterfile total. Some of these components were then compared with provincial benchmarks. The difference between benchmarks and the provincial total of adjusted components was then distributed in proportion to the provincial share of the relevant component. Ultimately, the sum of a particular component or group of components agreed with the provincial benchmark upon completion of this step. For example, wages and salaries, commission from employment, and military pay as estimated separately, were combined and reconciled with provincial benchmarks as obtained from employers' records compiled by the Department of National Revenue.

Income from self-employment, except income from farming activities, was not adjusted beyond the first round; i.e., the apportioning of components into masterfile totals. Farm income, however, was adjusted in a fairly comprehensive way, allowing for non-reporting of subsistence farms as well as for underreporting of those who filed income tax returns.

The adjustment procedures used to develop farm income estimates for 1966 cannot be repeated for subsequent years because a Census of Agriculture is taken every five years only. It was the

¹⁴ Canada, DBS, Catalogue No. 21-202.

¹⁵ Canada, DBS, Catalogue No. 61-208.

¹⁶ Canada, DBS, *Statistical Report on the Operation of the Unemployment Insurance Act*, Catalogue No. 73-001 (monthly). The January issue contains data for the previous two calendar years by province.

1966 Census of Agriculture which offered a unique opportunity to reconcile farm taxfilers with farm operators. Income from farming activities thus will be based on a revised methodology henceforth. 1966 income from farming activities, as contained in employment income, may have to undergo further revisions.

The reconciliation, adjustment, and distribution of employment income was completed at this stage. It should be recalled that the employment-income portion of money income consists of "earnings" which are composed of wages and salaries, commission from employment and military pay and allowances. Moreover, it consists of "income from self-employment" which is made up of a farm and a non-farm portion. The latter consists of commission net income, income from unincorporated business activities, and professional income.

Non-employment income subject to taxation can be discussed in terms of three broad categories: investment income, old-age pension, and "miscellaneous income items" such as rental income, alimony, estate income and others.

Investment income was adjusted after the estimation of employment income had been completed. While several approaches had been explored, the final procedure required the calculation of a provincial investment income to employment income ratio from 1961 Census data. When applied to 1966 employment income, this ratio yielded an estimate of investment income by province. This provincial investment income was used as a benchmark into which county investment income was apportioned on the basis of the percentage distribution of investment income from taxation data, appropriately reconciled with the masterfile.

Old age pension is underreported to the Department of National Revenue because many old people belong to income classes which are non-taxable. Thus, old-age pension, although subject to taxation, is poorly reflected in data obtained from National Revenue. Consequently, old-age pension from taxation files was replaced with an independent estimate and then added into the money income series. This estimate was based on provincial totals of old-age pensions as obtained from administrative records. It was distributed among relevant counties according to the percentage distribution of the population aged 65 years and over.

A number of non-employment income components which are subject to taxation contribute very little to aggregate income. Not only would it have been exceedingly difficult to obtain reliable benchmarks for these components on a provincial basis, it would also have been difficult to design an appropriate weighting mechanism. To put it succinctly, it would have taken a great deal of effort without being assured that the revised figures would have been any better than the original figures. Thus,

a number of minor components obtained from "sample data" such as superannuation, alimony received, annuity income, estate income, rental income, and miscellaneous income, were apportioned into the masterfile only, but not adjusted beyond this stage. This aspect completes the discussion on income components subject to taxation, and various methods of adjustments. The following paragraphs will explain procedures of estimating income for small areas if such income is not subject to taxation.

One of the more prominent components is family and youth allowances. Administrative records provided the provincial totals, and these were apportioned into counties by applying the same principles used for distributing old-age pension, except that the age-specific population for these transfer payments belonged to the age groups zero to fifteen for family allowances, while 16 and 17 year olds determined the distribution of youth allowances.

Veterans pensions were allocated to individual counties according to the percentage distribution of people reporting war service with "Allied Forces". The benchmark unit was the Veterans Affairs District in this case, and the small area was the county or part of a county. Parts of counties were then aggregated into counties, and county payments were added to other non-employment income components for relevant locations.

All other transfer payments were combined into one provincial benchmark and distributed into counties according to a weighted distribution of non-taxable taxfilers.

Once the various components had been adjusted according to methods best suited to the data at hand, these adjusted components were aggregated by county into employment income and non-employment income plus total money income.¹⁷ The actual income figures for these categories are appended to this article.

Comparison of Data with Other Sources

Differences between small-area income estimates and personal income from National Accounts were described earlier. It was explained that conceptual differences do not permit a reconciliation at this stage and that National Accounts will yield higher values because they include institutions which are considered part of the personal sector.

¹⁷ The various components were listed earlier under concepts, but are repeated here for quick reference. **Employment Income:** Wages and Salaries, military pay and allowances, commission income from employment, net commission income from self-employment, business income from unincorporated non-farm enterprise, professional income, income from non-incorporated farming activities. **Non-employment Income:** Investment income, net rental income, old-age pension, superannuation, alimony, annuity income, estate income, miscellaneous income subject to taxation, family and youth allowances, veterans pensions and allowances, unemployment insurance benefits, workmen's compensation, other federal and provincial transfer payments to individuals.

One form of comparison was carried out between small area money income and income before taxes as obtained for the survey of consumer finances (SCF). This comparison was feasible because of conceptual similarity between these two series. Both of these series use money income of individuals before taxes, although SCF covers a slightly smaller universe as will be explained shortly.

The Consumer Finance Research Staff of DBS conducts a survey of consumer finances every two years. From this survey income data are available for large regions, i.e., Atlantic Provinces, Quebec, Ontario, Prairies, and British Columbia. Small-area income estimates were aggregated for these regions as well as for all provinces and compared with an interpolated figure from the SCF. Interpolation was necessary since surveys had been conducted covering the years 1965 and 1967. The SCF data for 1966 thus are not true survey data. Nevertheless, it was shown that small-area data agreed within a 5.0 per cent margin when compared with "total income" for all provinces, and regional totals agreed anywhere from 2.4 per cent for Quebec to 7.0 per cent for Ontario. In all instances small-area data were **higher** than SCF data.

The difference was much smaller for "employment income". Expressed in per cent of SCF data it was 2.2 per cent for all provinces with the Atlantic region showing the smallest discrepancy, namely 0.3 per cent and Ontario the highest of 4.2 per cent. Again, small-area estimates were higher than SCF income figures.

The fact that small-area estimates were higher than SCF income figures results from the exclusion of institutional populations in the survey of consumer finances, whereas they are contained in the taxation sample. Moreover, the slight excess of small-area over SCF income can be explained by the fact that interpolation between 1965 and 1967 for SCF data was performed on the assumption that the trend was linear. It stands to reason that the growth pattern was non-linear, and the figures should have been weighted closer towards 1967 values. Such a procedure would have reduced the discrepancy appreciably, especially in Ontario where a substantial growth in income was experienced.

While these comparisons provide some form of reassurance, the small-area income estimates must be considered preliminary and subject to further revisions. Besides revisions due to refinements or changes in methodology, the series will be expanded in other ways. This, and other aspects, will be explained in the final section.

Plans for the Future

At present the process of estimating farm income is being revised, primarily because a correction for non-filers cannot be applied in intercensal years. As soon as this method is operational, the 1967 series will be produced.

The methodology, as applied to 1967 data, will also be applied to 1968 data, but a number of data inputs are not available as of February 1971. It is anticipated that all 1968 data will be available by early spring and that 1967 and 1968 small-area income estimates will be published in late spring or early summer. It is intended to issue a preliminary release of these data through the DBS *Daily Bulletin*.

Following this publication of data, a technical paper will be produced. It will deal with concepts and definitions, and will explain the methodology and its underlying rationale in detail.

Another aspect of developing this series centers around disposable income. The estimation and removal of federal and provincial income tax from the present income estimates is required for this purpose. As was mentioned earlier, the Quebec income tax system poses a number of obstacles which have to be overcome before these plans can be realized. The publication of the aforementioned technical paper may conceivably have to wait until this hurdle is cleared.

After 1971, Census data will permit a further reconciliation, and hopefully this step will lead to the end of the development stage. Thereafter, indirect methods of estimation, which should permit greater timeliness, may be considered.

Once the small-area income series is operational, and once data are processed with the shortest possible timelag, a backward extension of this series will be considered. Unfortunately, the relatively low quality of data input prior to 1966 may not make such a step feasible. Moreover, a number of adjustments cannot be carried out in a way identical to the procedures used for 1966 estimates; e.g., a reconciliation of earnings with employers records and apportioning of "sample data" into masterfile totals is largely impossible because these records are not available for many years prior to 1966.

Undoubtedly, ways can be found to overcome some of these difficulties, but the resulting historical income series would not be consistent over time. Nevertheless, the project will have to be thought out in greater detail, alternatives will have to be explored and only then will it be possible to decide the feasibility of such a series. It is too early to give up on this aspect of the project, but the possibility of abandoning the historical series prior to 1966 cannot be ruled out.

APPENDIX

On the first page of Table 1, Canada totals are shown. These are actually the totals accumulated for ten provinces. They do not include any income received by residents of the Territories.

For any geographic entity total income is decomposed into employment and non-employment income. These income components are estimated on the basis of residence of income recipients. Provincial totals precede their relevant county data.

In a number of locations the assignment of a municipal address to a particular county code posed some identification problems. Thus some tax returns may have been allocated to a neighbouring county. Consequently, a combination of adjacent counties or group of counties will produce a more reliable estimate than could be expected for a single county. It is recommended to use the following combinations of counties in the provinces of New Brunswick, Quebec, and Ontario:

New Brunswick:

- (1) Madawaska and Victoria
- (2) Kings and St. John
- (3) Albert and Westmorland

Quebec:

- (1) Labelle, Montcalm, and Terrebonne
- (2) Bonaventure, Matane and Matapedia

Ontario:

- (1) Halton, Ontario, Peel, Wentworth, and York
- (2) Lincoln and Welland
- (3) Dundas, Glengarry, and Stormont
- (4) Bruce and Huron

It will be tempting to divide small-area income data by the corresponding population figures thereby obtaining per capita income. While such income may indicate elements of regional disparity, it cannot be conclusive. For certain forms of analysis, the income per family should be a superior measure; but once family income is used, family size and composition should also be considered.

If the limitations of using per capita income for analytical purposes are recognized, the notion of "statistical significance" should be kept in mind. One may wish to compare per capita income for two locations in order to judge the existence and severity of income differentials. Undoubtedly, per capita income for two locations will not be alike, but how large a difference must occur to speak of a "significant difference"? To put it a little more precisely, one should ask: Is this difference large enough to reflect a real disparity, or is it simply

caused by random fluctuations; i.e., would the difference be zero if data were perfect?

This somewhat intuitive approach to the notion of "statistical significance" will be further emphasized by comparing per capita income for Carleton and Wentworth county which include the cities of Ottawa and Hamilton respectively. Based on small-area income estimates, the per capita income is \$2,456 for Carleton and \$2,680 for Wentworth.¹⁸ Thus, one may wish to conclude, Wentworth residents, which includes Hamilton residents, are better off because on the average they have an income which is \$224 larger than that of Carleton or Ottawa residents.

Taxation Statistics publish income per taxable return, which is \$5,574 for Hamilton and \$5,753 for Ottawa. Now Ottawa appears to be "better off" than Hamilton by \$178 on the strength of these data.

Both arguments are not necessarily inconsistent. It could be true that taxfilers with taxable returns are better off in Hamilton, and that people in general are better off in Ottawa on the basis of their respective income. However, either difference may have arisen from random fluctuations in the data, and for all practical purposes residents in both areas experience the same level of living when judged by income data. With additional information "statistical significance" could actually be determined within certain probability limits. This additional information is not available, but the fact that it is missing does not preclude one's asking questions concerning statistical significance.

Hopefully, this illustration will help to prevent the indiscriminate use of per capita income data. Moreover, all data are subject to interpretation, which in turn remains the responsibility of the interpreter. Nobody should attempt to read more into the data than is warranted, especially in view of the fact that the body of the article has explained a number of aspects which indicate that acceptable approximations and absolute truth are fairly far apart for certain types of income components.

¹⁸ These figures are based on the assumption that Wentworth county as defined by the Census contains a population which corresponds to income data gathered by National Revenue. Actually DNR covers a slightly larger area by including part of Halton county and hence the census population of Wentworth should be increased by approximately 54,000 to make income and population data compatible. (See also this appendix on the subject of county combinations.)

APPENDIX

TABLE 1. Estimated Money Income and its Main Components by County or Census Division, 1966

| Location | Main components | | Total income |
|---|------------------|------------------|-------------------|
| | Employment | Non-employment | |
| | \$'000 | | |
| Canada ¹ | 33,433,332 | 5,437,892 | 38,871,224 |

Time Series Analysis
of Unemployment Data
Using Seasonal Adjustment

JUN 22 1971

UNIVERSITY OF TORONTO

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

SYMBOLS

The following standard symbols are used in this and other DBS publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero.
- amount too small to be expressed.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.
- MCD months for cyclical dominance (see above)

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 9

The **National Income and Expenditure** portion of this table has been revised to show Gross National Product at 1961 Prices, Business gross fixed capital formation and Labour income.

Section 3, Table 4.1 — Canadian Balance of International Payments

The revised presentation introduced with this issue permits the user to reconcile the balance of payments data to the national income and expenditure accounts.

Section 4, Tables 1, 2, 12-19 — Labour

Current data not available for this issue will appear in the Weekly Supplement to this Review.

TIME SERIES ANALYSIS OF UNEMPLOYMENT DATA USING SEASONAL ADJUSTMENT

Peter Hicks*

Unemployment statistics are used for a variety of purposes: as an aid in developing and monitoring the effectiveness of policies to reduce unemployment, and as a barometer of economic conditions. For these purposes, it is essential to have current information on unemployment and its underlying trend. For the latter purpose it is important to eliminate seasonal movements. Seasonal movements are large in Canada mainly because of the effect of the climate in restricting outdoor work in the winter months. While recent attention has been mainly directed towards the trend of unemployment, seasonal unemployment remains a major concern and estimates of seasonal patterns are valuable in their own right. The seasonal adjustment process, which separates the seasonal, trend-cycle and irregular components of a time series, gives the kind of analytic information that is needed for the different uses to which the unemployment data are put.

The main outputs from the seasonal adjustment procedure are shown in Chart 1. In the upper line is the original, unadjusted data for Unemployed, Canada, from 1960 to 1971. The seasonal pattern set out in the bottom line is a plot of the seasonal factors, or indexes, derived from the original series. In the centre is Unemployed, Canada, adjusted for seasonality (obtained by dividing each month in the original series by the seasonal factor for that month).

It will be noted that the seasonally-adjusted series contains irregular as well as long-term cyclical fluctuations. These irregular movements may be removed or reduced by taking a moving average of the seasonally-adjusted series. The number of months used in calculating the moving average is determined by the MCD or months for cyclical dominance, an analytic measure which indicates the shortest span of months for which the average change in the cyclical factor is greater than in the irregular factor. In other words, an MCD moving average is the shortest moving average that can be used to produce a series that will reflect mainly changes in the underlying trend rather than irregular changes.

Every year DBS produces a publication which releases the main series produced by the seasonal adjustment of labour force data, including unemployment.¹ The current issue includes tables from 1954 to 1970 showing original data, seasonal factors, seasonally-adjusted series, and MCD moving averages for a large number of labour force statistics. Charts 2 and 3 illustrate the kind of information found in this publication.

Chart 2 shows the seasonally-adjusted data and the MCD trend for selected unemployment series. These series show that the increase in unemployment between 1966 and 1970, while general, was not equally spread among all sectors. The rapid growth in 1970 was mainly among adult men. The increase was also most pronounced for what might be termed medium-duration unemployment, rather than among either the long-term unemployed or among persons who have been seeking employment less than one month or are on temporary layoff. Regionally, it is perhaps noteworthy that the Atlantic region, where the unemployment was already at a high level, did not substantially contribute to the current upswing in unemployment. This kind of clear picture could not be obtained by using original data because the large seasonal swings in the original data would obscure the underlying trend.

Chart 3 shows the 1970 seasonal pattern calculated by the seasonal adjustment program for the same series that were shown in Chart 2. The factors are shown as percentages and the average for the year approximates 100 per cent. This use of percentages allows easy comparison of the patterns of different series. The chart clearly shows the different seasonal pattern of unemployment for younger persons that is associated with the school year. The chart also shows that different durations of unemployment have quite different seasonal patterns, both in amplitude and in shape.

(Continued on page 113)

CONTENTS OF CANSIM AS OF APRIL 15, 1971, PAGE 6.

As of April 15, 1971, CANSIM contained 26,700 time series, an increase of 2,700 from the 24,000 series last reported in the December, 1971 issue of this Review. In the table on page 6 the contents of CANSIM are divided into those which are published in this Review and additional related series. More details are available in the *Summary Reference Index* and the *Series Directory* (see inside back cover).

Available historical and current data for these series may be purchased at 15 cents each, either on a computer printout (minimum charge \$5.00) or

on magnetic tape (on user's tape, series cost plus handling, minimum charge \$25.00). A special CSR (standard) tape at \$150.00 (on user's tape, plus handling) contains the time series in this Review plus additional series, including some 700 from the Bank of Canada. A manipulative program, MASSAGER, which accepts CANSIM magnetic tapes as input, is available at nominal cost from COMPUTEL, Ottawa.

Inquiries should be directed to the General Time Series Staff, Dominion Bureau of Statistics, Ottawa, 3.

Contents of the CANSIM Time Series Data Bank as of April 15, 1971

¹ Series included which have security codes other than "public" are so noted in the CANSIM Series Directory. Inquiries regarding such secured series should be directed to the data source.

² Terminated series (indicated by "T" in the CANSIM Series Directory), are series which are no longer active, but are considered by the data source to be of continuing interest.

³ All series are confidential. Inquiries should be made to the National Output and Productivity Division, DBS.

⁴ Includes 4,404 monthly series on the base but not ready for release.

⁵ Labour Force Survey - Includes series being verified and not released as of April 15, 1971.

⁶ Data not released as of April 15, 1971.

⁷ Five series are available thrice yearly (Indexes of Prices Paid by Farmers, and Farm Wages in Canada).

⁸ Includes 1,487 annual series on the base but not ready for release.

⁹ Thirty monthly and 30 annual unrevised series on the base 1956=100.

LABOUR FORCE (More detail in Section 4, Table 3)

TOTAL LABOUR FORCE DECLINED FROM FEBRUARY TO MARCH MAINLY AS A RESULT OF A DROP IN UNEMPLOYMENT. THE SEASONALLY-ADJUSTED UNEMPLOYMENT RATE FELL FROM 6.2 IN FEBRUARY TO 6.0 IN MARCH.

| | total labour force | total employed | employed non-agriculture | unemployed | unemployment rate | not in the labour force |

INDUSTRIAL PRODUCTION (More detail in Section 3, Table 2.2)

THE SEASONALLY ADJUSTED INDEX OF INDUSTRIAL PRODUCTION ROSE TO 172.4 IN FEBRUARY, A GAIN OF 0.6 PER CENT FROM THE REVISED JANUARY LEVEL OF 171.4. THE PRINCIPAL FACTOR IN THE GAIN WAS THE 3 PER CENT ADVANCE IN DURABLE MANUFACTURING, ALMOST ENTIRELY DUE TO A SHARP ADVANCE IN MOTOR VEHICLE OUTPUT.

¹Total of all series available monthly as in column 10, Section 10, Table 6. See footnote 7 and 8 to this table for explanation of discontinuity commencing with January 1970, and January 1971 respectively.

INCOME & EXPENDITURE ACCOUNTS, BALANCE OF INTERNATIONAL PAYMENTS (More detail in Section 3, Tables 1.2 and 4.1)

SLUGGLISH GROWTH IN ECONOMIC ACTIVITY IN THE FIRST THREE QUARTERS OF 1970 GAVE WAY TO A SIZEABLE GAIN IN GNP OF 1.6 PER CENT IN THE FINAL QUARTER. AFTER DISCOUNTING A MARGINAL PRICE INCREASE, THE GAIN IN REAL TERMS OF 1.5 PER CENT WAS PARTICULARLY NOTABLE. SOMEWHAT OFFSETTING THE ACCELERATED RISES OF MOST INCOME COMPONENTS WAS A SHARP 11.7 PER CENT DROP IN CORPORATION PROFITS.

THE CURRENT ACCOUNT SURPLUS ROSE TO A RECORD QUARTERLY LEVEL OF 571 MILLION DOLLARS PRINCIPALLY REFLECTING THE SPURT IN MERCHANDISE TRADE SURPLUS TO 991 MILLION DOLLARS.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in form inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other form-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts, Fourth Quarter 1970 (D. B. S. 13-001).

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at overage prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts, Fourth Quarter 1970 (D. B. S. 13-001).

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change. Source: National Income and Expenditure Accounts, Fourth Quarter 1970 (D. B. S. 13-001).

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance.

²Excludes the refundable tax on corporate cash profits introduced May 1966. Refunding of the tax began in the third quarter 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

Table 1.9: relation between gross national product at market prices and gross domestic product at factor cost, (million dollars)

| years and quarters | gross national product at market prices | deduct: | | | add: | | gross national product at market prices | deduct: | | | add: | |

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. ¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. ³The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ⁴Includes miscellaneous manufacturing industries. ⁵Includes also publishing and allied industries. ⁶Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period of estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Annual figures for inventories and unfilled orders are end of December values. ⁴Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D. B. S.

Table 2: manufacturing shipments¹ by industry based on the 1960 standard industrial classification (million dollars)

| monthly averages or months | | total shipments | non-durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), D. B. S.; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. ¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D. B. S.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Source: Refined Petroleum Products (45-004), D. B. 5.

Note: Components may not add to totals due to rounding differences. ¹The data are collected for 1,400 municipalities and individual figures are available on request. ²Historical data back to 1920 are available in "Historical Monthly Statistics" Catalogue No. 11-503, occasional. Starting with January 1966, the number of municipalities has been reduced to 55 following the amalgamation of the cities of Fort William - Port Arthur (Thunderbay City). ¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of Nfld. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs. ¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. ¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), D. B. S.

Table 1: value of retail trade by type of business and province, based on the 1960 standard industrial classification - concluded

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Instalment financing components do not include interest and other unearned income finance charges. ¹Column numbers refer to tables 3 and 4 section 11.²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months.³Includes special transaction-trade, not shown separately.⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), D. B. S.

¹Column numbers refer to tables 3 and 4, section 11. ²The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ³Includes special transaction-trade, not shown separately. ⁴Includes scrap. ⁵Some series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), D. B. S.

¹Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ²Monthly averages for 1968 and 1969 may differ from the averages of the monthly data due to revisions which cannot be allocated by months. ³Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, D.B.S.

¹Includes Class 1 carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from inter-city and rural bus operations. Regular and chartered services are included. ²Includes Class I and Class II carriers only. These are trucking firms having \$100,000 or more gross annual operating revenues. ³Includes Class I carriers only. These are carriers having \$100,000 or more gross annual revenues primarily from urban transit operations. Data are totals for motor bus, trolley coach, street car, subway and chartered services. Sources: Motor Carriers-Freight, Quarterly (53-005), Passenger Bus Statistics (53-002) monthly, and Urban Transit (53-003) monthly, D.B.S.

¹Monthly averages for years 1967 and 1968 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 85 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ³Cargo includes air freight and express but excludes mail and excess baggage. ⁴United States and other foreign carriers having scheduled services into and out of Canada. Excludes passengers in transit through Canada.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loan advances and investments. ²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical or Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitation services.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover. *Selected Economic Indicators* appearing in the Section I are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II, X-11 version.

The MCD, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

SYMBOLS

The following standard symbols are used in this and other DBS publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero.
- amount too small to be expressed.
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.
- MCD months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 3, Table 3.1 – Financial Flows Matrix

The National Income and Expenditure Accounts revisions result in some conceptional and statistical changes to the Financial Flows Accounts. Revised data for the Financial Flows Accounts are not comparable with those of earlier periods which do not reflect these changes. For details of these revisions see National Income and Expenditure Accounts, 1926-68. Financial Flows Matrices in this issue reflect the revisions of the National Income and Expenditure Accounts for 1968, 1969 and 1970.

A new publication of the historical quarterly series for all sector and category tables, and annual matrices covering the first quarter 1962 onwards, is expected to be released in 1971.

Data for the fourth quarter 1970 are published in the present issue of the Review. Supplementary tables covering revised fourth quarter 1969, annual 1969 and 1970 appear on pages 116-121 of this issue.

Section 3, Table 4.1-4.3 – Balance of International payments.

Data for the first quarter 1971 will appear in the Weekly Supplement of this Review dated June 24th.

Section 4, Tables 1, 13, 14, 16-19 – Employment Indexes

February and March 1971 data for these tables of Section 4 are not currently available. It is expected that this information will be contained in the next issue of this publication.

Section 12, Table 4 – Operating Statistics of Air Carriers in Canada

The series Revenue Passengers Carried by Foreign Carriers has been deleted from this table because current data are no longer available.

GNP at market prices rose 1.7 per cent to reach \$87.9 billion. Real GNP seems to have lost momentum; it moved at .6 per cent against fourth's quarter 1.5 per cent to a level of \$64.6 billion.

Natale contributions made by consumer purchases of durables and by government purchases more than offset a very large fall in net exports of goods and services. The swing in non-farm business inventories although large, accompanied a nominal accumulation.

ALL DATA SEASONALLY ADJUSTED AT ANNUAL RATES.

Reversed movements on both goods and services balances, more particularly on goods, resulted in a reduced surplus, from \$2196 million in the fourth quarter to \$896 million in the first.

Labour income, indirect taxes and capital consumption allowances are the components that contributed the most to the rise in GNP

NATIONAL INCOME AND EXPENDITURE ACCOUNTS, FIRST QUARTER, 1971

A rather mixed picture emerges from a reading of preliminary estimates of the National Income and Expenditure Accounts for the first quarter of 1971. The preliminary fourth quarter 1970 estimates of Gross National Product in real terms suggested a renewed strong pace of activity, which appeared remarkable in view of the loss of production due to the automobile strike. This rate of expansion was apparently not maintained in the first quarter, despite the post-strike recovery in the automobile industry. On the other hand, domestic demand accelerated sharply in the quarter, but most of this increased demand was met by imports rather than by domestic production.

Gross National Product at market prices, seasonally adjusted at annual rates, rose by 1.8 per cent to reach \$87.9 billion, compared with a rise of 1.6 per cent in the fourth quarter. However, most of this gain reflected higher prices, as the implicit price deflator for GNP, which had remained practically unchanged in the fourth quarter, rose by 1.1 per cent in the first quarter. After adjusting for price changes, constant dollar GNP rose by 0.6 per cent in the first quarter compared with a rise of 1.5 per cent in the fourth quarter. (There are indications at the moment of issuing this report that the first estimates of the balance of external transactions incorporated here might be revised upward; if these indications are confirmed, they will result in a somewhat higher GNP estimate.)

Domestic demand, that is the demand for goods and services by Canadian residents whether on goods and services produced in Canada or abroad, was very strong in the first quarter, showing a rise of 3.3 per cent compared with a decline of 0.3 per cent in the fourth quarter. Much of the rise in domestic demand was due to increased spending on products of the North-American automobile industry, including a rebuilding of the stocks of motor vehicle dealers, as normal supplies of these products became available again upon termination of strikes in the industry. Demand for other goods and services also appears to have increased at a faster rate in the quarter. This was reflected in increases in most expenditure components as well as in increased imports of both automotive and other products. However, due to the higher import content of domestic demand in the quarter, which was only partially offset by increased exports, the value of Canadian production rose by much less than domestic demand.

Quarterly changes in Gross National Expenditure in the fourth and first quarters were dominated by swings in the balance of transactions in goods and services with non-residents. In the fourth quarter the balance (on a revised basis) rose by \$1.5 billion as compared to the previous quarter to reach an unprecedented surplus of \$2.1 billion. It then fell back sharply in the first quarter by \$1.2 billion

to a level of \$0.9 billion. These swings in the overall balance originated in the merchandise account and were attributable to two effects reinforcing each other. First, the automobile strikes had a greater impact on Canada's automotive imports than on its automotive exports and this led to a sharp improvement in the balance of trade in these products in the fourth quarter and to a subsequent sharp deterioration in the first quarter. (It may be noted that the gain in net exports of automotive products (exports less imports) in the fourth quarter was more than offset by declines in inventories and in other final expenditure components.) Second, there were similar swings in the balance of transactions in other than automotive products due to increases in such exports in the fourth quarter, while imports remained flat, and to flat exports in the first quarter while imports rose.

The major strength in private demand was shown by household expenditure on durable goods and by new residential construction. The relative buoyancy of this demand may have been partly due to generally easier credit conditions in recent months.

The increase in consumer spending on durable goods of 4.5 per cent was one of the largest in recent years. Much of this gain was in expenditure on new automobiles, up by nearly 15 per cent from the strike-affected fourth quarter. However, spending on other durable goods also rose quite strongly, particularly on home furnishings (for example furniture and carpets), and household appliances—goods which are partly associated with new housing. The gains made by these two categories of 6.5 per cent and of 8.2 per cent respectively were well above their quarterly increases in the last two years.

Consumer spending on other than durable goods was rather sluggish, especially in volume terms. Expenditures on semi-durable goods showed a rise of only 0.5 per cent after an unusually strong 5.1 per cent gain in the fourth quarter. Women's and children's clothing were the only items in that group to show significant increases. Spending on non-durable goods decelerated, particularly in volume terms, largely because of declines in alcoholic beverages. Services showed an estimated 1.4 per cent rise, but in real terms also registered a smaller than usual rate of advance. The relatively slow pace of advance of these categories of consumer expenditure offset the large gain shown by durable goods, so that although total personal expenditure on consumer goods and services made approximately the same current dollar gain of 1.5 per cent as in the previous two quarters, it showed a volume deceleration; the constant dollar increase of 1.0 per cent compared with gains of 1.6 per cent in the fourth quarter and of 1.3 per cent in the third quarter of 1970.

Expenditure on new housing rose by 5.6 per cent. Although this increase was much smaller than the 12.7 per cent gain shown in the fourth quarter, when the sector benefited from the high level of starts in the latter part of 1970, the current increase was nevertheless sizable. Most of the gain in new residential construction was attributable to work carried over and especially to completions, which rose by nearly 10 per cent. An unusually severe winter in many parts of Canada may have contributed to the lower level of starts of residential structures in the quarter. They slowed from an annual rate of 256,000 units in the fourth quarter to a rate of 203,800 units in the first quarter. In April starts rebounded to an annual rate of 253,100 units.

The government sector was another area of support to economic activity. Government current expenditure on goods and services rose by 3.6 per cent with all three levels of government showing substantial increases. The most notable gains were shown by wages and salaries and by provincial medicare expenditure. Government fixed capital formation rose by 3.2 per cent, with the major part of the increased outlays due to highway construction by provincial governments. Other government payments, especially transfer payments to persons at the provincial level, also rose substantially. With total outlays outpacing the growth in revenues, the surplus of the government sector as a whole, on a national accounts basis and seasonally adjusted at annual rates, fell from \$660 million in the fourth quarter to \$184 million in the first quarter.

Fixed capital formation by businesses was weak in the quarter. Investment in plant and equipment rose by 0.6 per cent with all of the increase in spending on non-residential construction, which was up by 1.3 per cent. There was no change in the rate of investment in machinery and equipment. After discounting accelerated price rises this quarter in both non-residential construction (where there were renewed sharp increases in costs of materials) and in machinery and equipment, plant and equipment spending in real terms fell by 0.7 per cent. Though the survey of business intentions indicates very little stimulus from machinery and equipment spending this year, partly because manufacturing industries are expected to show a decline in their investment outlays, it does suggest some strength in non-residential construction for most other industries and especially utilities; the intended percentage increase in spending on business non-residential construction in 1971 of close to 10 per cent is approximately the same rate as was realized in 1970.

Business non-farm inventories, which had been depleted by \$652 million in the fourth quarter, registered a nominal increase of \$36 million in the first quarter, despite a substantial accumulation in the stocks of retail trade entirely accounted for by

the rebuilding of motor vehicle inventories. Depletions were most marked in manufacturing, where they were concentrated in the stocks of durables, particularly electrical goods. This reduction in manufacturers durable goods inventories may have resulted in part from the strength of consumer demand for such goods in the quarter. With new orders running ahead of shipments, the period ended with an increased backlog of unfilled orders.

On the income side a notable gain was shown by corporation profits, up by about 10 per cent. However, this gain, in large part due to resumption of normal production in the automobile industry, apparently did not fully reverse a decline of around 11.5 per cent in the strike-affected fourth quarter. Apart from the fourth quarter, profits were at their lowest level since the second quarter of 1968. (Because corporation profits estimates are very preliminary, no industrial detail is yet available.)

Wages, salaries and supplementary labour income rose by 1.8 per cent in the first quarter compared with 2.4 per cent in the fourth quarter. The first quarter gain was approximately the same as the average quarterly rate of increase during 1970. Wages and salaries in the goods-producing industries went up by 2.0 per cent and accounted for about 40 per cent of the total increase. Most of this gain occurred in manufacturing, which was up by 3.0 per cent. The recovery of production in the automobile industry was of course a factor behind this strong increase. In the service-producing industries, sizable gains in finance and in commercial and non-commercial services were somewhat offset by smaller than usual gains in transportation, communications and other utilities and in trade.

Other income components frequently display quite volatile changes. On balance their movements dampened the growth in national income in the first quarter. In particular, accrued net income of farm operators from farm production fell by 23.5 per cent. Although the value of grain production was virtually unchanged (an increase in the estimated value of the new crop offsetting a decline in the profits of the Canadian Wheat Board), both the value of livestock production and cash returns from other products declined in the quarter. Dividends paid to non-residents (a negative entry) rebounded sharply by 28 per cent from a low fourth quarter level. The inventory valuation adjustment registered a large negative figure of \$448 million in the first quarter compared with minus \$32 million in the fourth quarter. (The inventory valuation adjustment is an entry designed to eliminate from the income side capital gains or losses in inventories; when inventory prices are rising, the entry is negative, when they are falling, it is positive.)

Partly due to a sharp increase in transfer payments to persons, up 6.1 per cent personal income made a further sizable gain in the first quarter of 2.1 per cent. The fourth quarter gain

LABOUR FORCE (More detail in Section 4, Table 3)

UNEMPLOYMENT INCREASED AND EMPLOYMENT DECLINED BETWEEN MARCH AND APRIL.
THE UNEMPLOYMENT RATE ROSE SHARPLY FROM 6.0 TO 6.7.

INCOME & EXPENDITURE ACCOUNTS, BALANCE OF INTERNATIONAL PAYMENTS (More detail in Section 3, Tables 1.2 and 4.1)

GROSS NATIONAL PRODUCT IN CURRENT DOLLARS RODE BY 1.7 PER CENT IN THE FIRST QUARTER — APPROXIMATELY THE SAME PERCENTAGE GAIN AS IN THE FOURTH QUARTER OF 1970. HOWEVER, THE 0.5 PER CENT GAIN IN CONSTANT DOLLAR GNP WAS CONSIDERABLY SMALLER THAN THAT OF 1.5 PER CENT SHOWN IN THE FOURTH QUARTER. THE SLOWED PACE OF ACTIVITY IN REAL TERMS OCCURRED DESPITE A POST-STRIKE RECOVERY IN THE AUTOMOBILE INDUSTRY.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹This item is the adjustment to take account of the accrued earnings of farm operators arising out of the operations of the Canadian Wheat Board. See also footnote 1, table 1.4. ²For a breakdown between government and business, see table 1.2. For source see Table 1.9.

INCOME & EXPENDITURE ACCOUNTS, BALANCE OF INTERNATIONAL PAYMENTS (More detail in Section 3, Tables 1.2 and 4.1)

GROSS NATIONAL PRODUCT IN CURRENT DOLLARS RODE BY 1.7 PER CENT IN THE FIRST QUARTER — APPROXIMATELY THE SAME PERCENTAGE GAIN AS IN THE FOURTH QUARTER OF 1970. HOWEVER, THE 0.5 PER CENT GAIN IN CONSTANT DOLLAR GNP WAS CONSIDERABLY SMALLER THAN THAT OF 1.5 PER CENT SHOWN IN THE FOURTH QUARTER. THE SLOWED PACE OF ACTIVITY IN REAL TERMS OCCURRED DESPITE A POST-STRIKE RECOVERY IN THE AUTOMOBILE INDUSTRY.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. Sources for above tables: Annual and Quarterly Estimates of the Canadian Balance of International Payments (67-201 and 67-001), D. B. S.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²Conado totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 17. The small differences result from the seasonal adjustment of the Conado and regional data having been carried out independently of each other. Source: The Labour Force, (71-001), D. B. S.

¹The unemployed as a percentage of the labour force for each region. Due to weighting differences, a simple average of the regional rates will not give the seasonally adjusted Conado rate on page 7, nor the unadjusted Conado rate in table 3. Source: The Labour Force, (71-001) D. B. S.

Table 9: not in the labour force by region¹ (thousands of persons)

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹The data in Tables 12 & 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month Greater industrial and area detail and more explanatory notes are given in the source publication named below. Excludes agriculture, fishing, trapping and public administration and defence. Source: Employment and Average Weekly Wages and Salaries (72-002), D. B. S.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²In addition to those listed, tobacco products; knitting mills; printing, publishing and allied; and miscellaneous manufacturing industries are included in non-durable manufacturing. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note Na 6 published in the June 1969 issue of the Canadian statistical review.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total new orders received during the period of estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ³Annual figures for inventories and unfilled orders are end of December values. ⁴Total manufacturing inventory owned by manufacturers including warehouse stocks. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D. B. S.

Table 2: manufacturing shipments¹ by industry based on the 1960 standard industrial classification (million dollars)

| monthly overages or months | | total shipments | non-durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

Table 3: manufacturing inventories¹ by industry based on the 1960 standard industrial classification (million dollars)

| end of year or month | total inventories owned | non- durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications. i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (2S-001), Trade of Canada, Exports (6S-004), D. B. S.; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. ¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. ¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentones plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Source: Refined Petroleum Products (45-004), D. B. S.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.

¹Monthly totals are not equivalent to annual data which include Newfoundland and Yukon and Northwest Territories for which only annual statistics are collected. ²Planks and boards, flooring and square timber. ³Hollow blocks including fireproofing and load-bearing tile. ⁴For building insulation only.

⁵Figures cover the production of firms which normally account for 90 per cent of the total for Canada. ⁶Factory sales of firms which normally account for 96% of total Canadian production.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of NFLD. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs. Sources: Price Index Numbers of Commodities and Services Used by Farmers (62-004); Farm Wages in Canada (21-002) Occasional; Course Grains Quarterly (22-001); Index Numbers of Farm Prices of Agricultural Products (62-003), D. B. S. and Livestock and Meat Trade Report, Dept. of Agriculture.

¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted.
²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, wieners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. ¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), D. B. S.

Table 1: value of retail trade by type of business and province, based on the 1960 standard industrial classification - concluded

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004). ² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 13.5 per cent. ⁴ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods. ⁵ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁶ Personal cash loans of over \$1,500, usually repaid in installments. From January 1971, amounts shown exclude unearned finance charges; for December 1970, the net figure was lower than the gross figure by 16.5 per cent. ⁷ The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are repeated in the unadjusted form. ⁸ Beginning in January 1971, the Other Personal Cash Loans and Instalment financing components do not include interest and other unearned income finance charges. Sources: Credit Statistics (61-004), D. B. S.; Bank of Canada, Dept. of Insurance, Dept. of Finance and Dept. of Agriculture.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. ¹Excluding revivals, increases, dividend additions, reinsurance acquired, credit insurance and pension bonds without insurance. Value totals are estimates projected from the sales reported by companies operating in Canada representing over 80% of new ordinary and of new group contracts. ²Total new settled-for ordinary sales in Canada. ³1969 data only are revised. Total sales figure does not include sales for Northwest Territories. ⁴Under new or amended contracts.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C. P. P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Source: Commercial

Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments.

²For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ³As of April 1, 1969 Industry and Trade and Commerce are combined. ⁴Under the Technical and Vocational Training Assistance Act. ⁵Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁶Includes treatment and rehabilitative services.

Sources: Canada Gazette and Dept. of Finance.

was 2.4 per cent, but the average quarterly gain during 1970 was notably smaller. With income taxes and other transfers to government rising by a moderate 1.6 per cent, personal disposable income also rose notably for a second consecutive quarter—up by 2.3 per cent in the fourth quarter and by 2.2 per cent in the first quarter. Because personal expenditure did not advance as rapidly as personal disposable income, the personal saving ratio (personal saving as a proportion of personal disposable income) rose further to 8.1 per cent in the first quarter. This ratio has been rising since the second quarter of 1970, when it was 6.8 per cent.

Price Movements

The rise in the implicit price index for Gross National Expenditure accelerated sharply in the first quarter of 1971. The rise of 1.1 per cent—the largest since the first quarter of 1970—compared with a 0.1 per cent increase in the fourth quarter. It may be noted, however, that the overall price deflator reflects shifting weights among the components of gross national expenditure as well as price changes of individual items. Such weight

shifts have been sizable in both the fourth and first quarters, especially with respect to the external trade sector. An alternative price measure with fixed weights based on the fourth quarter composition of Gross National Expenditure would have shown a lesser price increase.

As is shown in the following table, price rises occurred in practically all categories of demand. The implicit price index for personal expenditure on consumer goods and services, which has been remarkably stable in recent periods, rose by a moderate 0.5 per cent in the first quarter. This increase was mostly due to a sharp rise in the durable goods price index component, which was affected by substantial increases in the prices of new and used automobiles. A small rise in the non-durable goods implicit price index of 0.3 per cent followed declines in the preceding two quarters. The services implicit price index rose at about the same rate as in recent periods. The only component price index of personal expenditure on consumer goods and services to show a decline was that for semi-durable goods, entirely because of falling prices of clothing and footwear.

| Residential construction | 1.2 | 1.2 | 1.2 | 1.7 | 1.1 |
| Non-residential construction | 0.6 | - 0.1 | 1.0 | 1.3 | 1.5 |
| Machinery and equipment | 1.2 | 0.8 | - 0.3 | 0.3 | 1.0 |
| Exports | 2.1 | 0.4 | 0.1 | — | 0.2 |
| Imports | 0.7 | 0.5 | - 0.8 | - 0.6 | 0.3 |
| Gross National Expenditure | 2.0 | 0.6 | 0.8 | 0.1 | 1.1 |
| Gross National Expenditure excluding value of physical change in inventories | 1.4 | 0.8 | 0.8 | 0.4 | 1.1 |

¹ Implicit price indexes are currently weighted (Paasche) and therefore reflect changes in expenditure patterns as well as price changes of individual items.

Although the implicit price index for business gross fixed capital formation as a whole showed the same price rise of 1.4 per cent as in the previous quarter, there were significant changes in its components. The price index for machinery and equipment showed an acceleration from a rise of 0.3 per cent in the fourth quarter to a rise of 1.0 per cent in the first quarter. Construction price indexes continued to rise at sizable rates. The wage components showed somewhat smaller rises in both residential and in non-residential construction, but the materials price indexes, which had shown price moderation in recent periods, rose sharply in the first quarter.

The appreciation of the Canadian dollar had no doubt been an important factor behind the smaller than usual increases in the implicit price index for exports and the declines in that for imports in the second half of 1970. By the beginning of 1971, most of the effects of the appreciation may have been incorporated in the trade price structure; both the exports and the imports implicit price indexes rose in the first quarter, though at very moderate rates. However, the rise in the implicit index for import prices was considerably dampened by an unusually large weight shift as between service imports and merchandise imports, as the value of transactions in the latter, which has the lower price index, rose very strongly in the quarter. The components of the implicit price index for imports show a 0.8 per cent increase for merchandise and 0.3 per cent increase for services.

The Government Sector

Total revenues of all levels of government combined (excluding inter-governmental transfers) rose by 3.0 per cent in the first quarter of 1971.

Much of the increase took place in revenues from indirect taxes, particularly at the provincial and local government levels where revenues from sale taxes, gasoline taxes and property taxes were considerably higher. Revenues from personal direct taxes rose by over \$200 million, with the increase concentrated at the provincial level and in contributions to the Canada Pension Plan. Returns from corporate direct taxes also rose, by \$160 million.

Total expenditures of all levels of government combined increased by over 4.5 per cent in the quarter. About half of the rise was in government current spending on goods and services with higher medicare expenditures and wages and salaries being major factors in the increase. Transfer payments to persons also rose substantially in the quarter particularly at the provincial level.

As a result of expenditures increasing more rapidly than revenues, the surplus of the government sector as a whole, on a National Accounts basis and seasonally adjusted at annual rates, fell from a rate of \$660 million in the fourth quarter to a rate of \$84 million in the first quarter. The most dramatic shift took place at the federal level which moved from a deficit of \$60 million in the fourth quarter to a deficit of \$1,096 million in the first quarter, the major factor in this swing being a sharp increase in transfer payments to the provincial governments. On the other hand, the deficit of \$552 million at the provincial level in the fourth quarter moved to a surplus of \$36 million in the first quarter, reflecting the irregularly high payments from the federal government and partially offsetting the movement in the federal deficit. The combined surplus of the other levels of government showed little change.
